

# Reachability index of the positive 2D general models

T. KACZOREK\*

Institute of Control and Industrial Electronics, Warsaw University of Technology, 75 Koszykowa St., 00-662 Warszawa, Poland

**Abstract.** It is shown that  $2(n+1)$  is the upper bound for the reachability index of the  $n$ -order positive 2D general models.

**Keywords:** reachability index, positive 2D general model, upper bound.

## 1. Introduction

In recent years a growing interest in positive two-dimensional (2D) systems has been observed [1–9]. An overview of some recent results in positive systems has been given in the monographs [1,10] and papers [5–9] and on the controllability of 1D and 2D systems in [11]. The asymptotic behaviour of positive 2D systems and their internal stability have been investigated in [8,9]. The local reachability of positive 2D systems described by the second Fornasini-Marchesini models [2–4] has been analyzed in [5]. It was shown that the reachability index of the  $n$ -order positive 2D systems is not bounded by  $n$ .

In this note it will be shown that  $2(n+1)$  is the upper bound for the reachability index of the  $n$ -order positive 2D systems described by the general model.

## 2. Problem formulation

Let  $R^{n \times m}$  be the set of  $n \times m$  real matrices and  $R^n = R^{n \times 1}$ .

Consider the 2D general model

$$x_{i+1,j+1} = A_0 x_{ij} + A_1 x_{i+1,j} + A_2 x_{i,j+1} + B_0 u_{ij} + B_1 u_{i+1,j} + B_2 u_{i,j+1} \quad (1a)$$

$$i, j \in Z_+ \text{ (the set of nonnegative integers)}$$

$$y_{ij} = C x_{ij} + D u_{ij} \quad (1b)$$

where  $x_{ij} \in R^n$  is the local state vector at the point  $(i, j)$ ,  $u_{ij} \in R^m$  and  $y_{ij} \in R^p$  are the input and output vectors and  $A_k \in R^{n \times n}$ ,  $B_k \in R^{n \times m}$ ,  $k = 0, 1, 2$ ,  $C \in R^{p \times n}$ ,  $D \in R^{p \times m}$ .

Boundary conditions for (1a) are given by

$$x_{i0}, i \in Z_+ \text{ and } x_{0j}, j \in Z_+ \quad (2)$$

Let  $R_+^n$  be the set of  $n$ -dimensional vectors with nonnegative components.

**DEFINITION 1.** The model (1) is called the positive 2D general model (P2DGM) if for all boundary conditions

$$x_{i0} \in R_+^n, i \in Z_+, x_{0j} \in R_+^n, j \in Z_+ \quad (3)$$

and every sequence of inputs  $u_{ij} \in R_+^m$ ,  $i, j \in Z_+$  we have  $x_{ij} \in R_+^n$  and  $y_{ij} \in R_+^p$  for  $i, j \in Z_+$ .

**THEOREM 1** [10]. The model (1) is a P2DGM if and only if

$$A_k \in R_+^{n \times n}, B_k \in R_+^{n \times m}, k = 0, 1, 2, C \in R_+^{p \times n}, D \in R_+^{p \times m} \quad (4)$$

where  $R_+^{p \times q}$  is the set of  $p \times q$  real matrices with nonnegative entries.

The transition matrix  $T_{ij}$  of the model (1) is defined by

$$T_{ij} = \begin{cases} I_n & \text{(identity matrix) for } i = j = 0 \\ A_0 T_{i-1,j-1} + A_1 T_{i,j-1} + A_2 T_{i-1,j} & \text{for } i, j > 0 \text{ (} i+j > 0 \text{)} \\ 0 & \text{(zero matrix) for } i < 0 \text{ or/and } j < 0 \end{cases} \quad (5)$$

From (5) it follows that for P2DGM (1)  $T_{ij} \in R_+^{n \times n}$  for  $i, j \in Z_+$ .

**DEFINITION 2.** The P2DGM (1) is called reachable at the point  $(h, k) \in Z_+ \times Z_+$  if for zero boundary conditions (ZBC) (2) and every vector  $x_f \in R_+^n$  there exists a sequence of inputs  $u_{ij} \in R_+^m$  for  $(i, j) \in D_{hk}$  such that  $x_{hk} = x_f$ , where

$$D_{hk} = \{(i, j) \in Z_+ \times Z_+ : 0 \leq i \leq h, 0 \leq j \leq k, i+j \neq h+k\}. \quad (6)$$

**DEFINITION 3.** The P2DGM (1) is called reachable for ZBC if it is reachable at any point  $(h, k) \in Z_+ \times Z_+$ . If  $x_f \in R_+^n$  is reachable at the point  $(h, k)$  then it will be said that the state  $x_f$  is reached in  $h+k$  steps. The number  $h+k$  steps is called the reachability index of (1) and it will be denoted by  $I_R$ , i.e.  $I_R = h+k$ .

**THEOREM 2** [10]. The P2DGM (1) is reachable for ZBC if and only if the reachability matrix

$$R_{hk} := [M_0, M_i^1, 1 \leq i \leq h; M_j^2, 1 \leq j \leq k; M_{ij}, 1 \leq i \leq h; 1 \leq j \leq k; i+j \neq h+k] \quad (7)$$

$$M_0 = T_{h-1,k-1} B_0, M_i^1 = T_{h-i,k-1} B_1 + T_{h-i-1,k-1} B_0, i = 1, \dots, h$$

$$M_j^2 = T_{h-1,k-j} B_2 + T_{h-1,k-j-1} B_0, j = 1, \dots, k$$

$$M_{ij} = T_{h-i-1,k-j-1} B_0 + T_{h-i,k-j-1} B_1 + T_{h-i-1,k-j} B_2, i = 1, \dots, h; j = 1, \dots, k, i+j \neq h+k$$

\* e-mail: kaczonek@isep.pw.edu.pl

contains an  $n \times n$  monomial matrix (in each of its rows and in each of its columns only one entry is positive and the remaining entries are zero).

For standard 1D  $n$ -order linear systems the reachability index is equal to  $n$ .

It is also known [5] that for standard (i.e. not necessarily positive) 2D general models the reachability index is equal to  $n$  ( $I_R = n$ ) i.e. any local state of (1) starting from ZBC can be reached in  $h + k$  steps for  $h + k \leq n$ .

For P2DGM (1) the set  $X_{h+k}^+$  of all local states that can be reached in  $h + k$  steps starting from ZBC by means of an input sequence  $u_{ij} \in R_+^m$  coincides with the set of all nonnegative combinations of the columns of the matrix (7), i.e.  $X_{h+k}^+ = \text{cone}R_{hk}$ .

It is known [5] that the reachability index  $I_R$  of a positive 2D linear systems is not bounded by  $n$ .

In [5] it was shown that the reachability index of the system (1) with  $A_0 = 0, B_0 = B_1 = 0$  and

$$\begin{aligned}
 A_1 &= \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}, \\
 A_2 &= \begin{bmatrix} 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 \end{bmatrix}, \quad B_2 = \begin{bmatrix} 1 \\ 0 \\ 1 \\ 0 \\ 0 \\ 0 \\ 0 \end{bmatrix} \quad (8)
 \end{aligned}$$

is equal to  $I_R = 13$  (for  $n = 7$ ). In [5] the conjecture was also given that  $n^2/4$  represents an upper bound for the reachability index of every 2D positive system.

In this paper it will be shown that  $2(n + 1)$  is the upper bound for the reachability index of the P2DGM.

### 3. Problem solution

Solution of the problem is based on the following lemma

LEMMA. Let

$$\begin{aligned}
 \det [I_n z_1 z_2 - A_0 - A_1 z_1 - A_2 z_2] \\
 = z_1^n z_2^n - \sum_{\substack{i=0 \\ i+j \neq 2n}}^n \sum_{i=0}^n d_{ij} z_1^i z_2^j. \quad (9)
 \end{aligned}$$

Then the transition matrices  $T_{ij}$  (defined by (5)) satisfy the equations

$$T_{n+k,0} = A_2^{n+k} = \sum_{i=0}^{n-1} d_{i0}^k A_2^i, \quad k = 0, 1, \dots \quad (10a)$$

$$T_{0,n+l} = A_1^{n+l} = \sum_{j=0}^{n-1} d_{0j}^l A_1^j, \quad l = 0, 1, \dots \quad (10b)$$

$$T_{n+k,n+l} = \sum_{\substack{i=0 \\ i+j \neq 2n}}^n \sum_{j=0}^n d_{ij} T_{i+k,j+k} \quad \text{for } k, l = 1, 2 \quad (10c)$$

Proof. The relations (10a) and (10b) follow from the Cayley-Hamilton theorem applied to  $A_2$  and  $A_1$ , respectively.

Taking into account that

$$\begin{aligned}
 [I_n z_1 z_2 - A_0 - A_1 z_1 - A_2 z_2]^{-1} \\
 = \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} T_{ij} z_1^{-(i+1)} z_2^{-(j+1)} \quad (11)
 \end{aligned}$$

we may write

$$\begin{aligned}
 \sum_{i=0}^n \sum_{j=0}^n H_{ij} z_1^i z_2^j &= \left( z_1^n z_2^n - \sum_{\substack{i=0 \\ i+j \neq 2n}}^n \sum_{i=0}^n d_{ij} z_1^i z_2^j \right) \\
 &\cdot \left( \sum_{i=0}^{\infty} \sum_{j=0}^{\infty} T_{ij} z_1^{-(i+1)} z_2^{-(j+1)} \right) \quad (12)
 \end{aligned}$$

where  $\sum_{i=0}^n \sum_{j=0}^n H_{ij} z_1^i z_2^j$  is the adjoint matrix to the matrix  $[I_n z_1 z_2 - A_0 - A_1 z_1 - A_2 z_2]$ .

From comparison of the matrix coefficients at the same powers of  $z_1^{-k} z_2^{-l}$  for  $k, l = 0, -1, -2, \dots, k + l < 0$  of the equality (12) we obtain (10c).

THEOREM 3. If the P2DGM (1) is reachable then it is reachable in at most  $2(n + 1)$  steps ( $h \leq n, k \leq n$ ), i.e.

$$I_R \leq 2(n + 1) \quad (h \leq n, k \leq n). \quad (13)$$

Proof. If the P2DGM (1) is reachable then by Theorem 2 the reachability matrix (7) contains an  $n \times n$  monomial matrix for  $h + k \leq 2(n + 1)$  since by the equation (10) the columns  $M_i^1, M_j^2$  and  $M_{ij}$  of (7) for  $h + k \leq 2(n + 1)$  ( $h \geq n, k \geq n$ ) are linear combinations of the columns of the matrix  $R_{hk}$  for  $h + k \leq 2(n + 1)$  ( $h \leq n, k \leq n$ ).

Example. Consider the P2DGM with

$$\begin{aligned}
 A_0 = 0, \quad A_1 &= \begin{bmatrix} 0 & 0 & 0 & 1 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \quad A_2 = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}, \\
 B_0 = 0, \quad B_1 &= \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \quad B_2 = 0. \quad (14)
 \end{aligned}$$

Using (5) and (7) we obtain

$$T_{i0} = \begin{cases} A_2 & \text{for } i = 1 \\ 0 & \text{for } i > 2 \end{cases}, \quad T_{20} = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \end{bmatrix}$$

## Reachability index of the positive 2D general models

$$T_{0j} = \begin{cases} A_1 & \text{for } j = 1 \\ 0 & \text{for } j > 2 \end{cases}, \quad T_{02} = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix},$$

$$T_{11} = \begin{bmatrix} 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \quad T_{12} = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix},$$

$$T_{13} = 0, \quad T_{14} = 0$$

$$T_{21} = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}, \quad T_{22} = I_4, \quad T_{23} = A_1,$$

$$T_{24} = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$T_{31} = 0, \quad T_{32} = A_2, \quad T_{33} = T_{11}, \quad T_{34} = \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

$$T_{41} = 0, \quad T_{42} = T_{20}, \quad T_{43} = T_{21}, \quad T_{44} = I_4$$

and

$$R_{13} = [M_0, M_1^1, M_2^1, M_3^2, M_{11}, M_{12}] = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix},$$

$$R_{31} = [M_0, M_1^1, M_2^1, M_3^1, M_1^2, M_{11}, M_{21}] = \begin{bmatrix} 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix},$$

$$R_{22} = [M_0, M_1^1, M_2^1, M_1^2, M_2^2, M_{11}, M_{12}, M_{21}] = \begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix},$$

$$R_{33} = [M_0, M_1^1, M_2^1, M_3^1, M_1^2, M_2^2, M_3^2, M_{11}, M_{12}, M_{13}, M_{21}, M_{22}, M_{23}, M_{31}, M_{32}] = \begin{bmatrix} 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}.$$

From Theorem 2 it follows that the P2DGM with (14) is not reachable for  $h + k \leq n = 4$  and it is reachable for  $h + k = 6 > n^2/4$ . The reachability index of the system satisfies the condition (13), i.e.  $I_R = h + k = 6 < 2(n + 1) = 10$ .
