# Decomposition of the pairs $(A, B)$ and $(A, C)$ of positive discrete-time linear systems 

TADEUSZ KACZOREK

#### Abstract

A new test for checking the reachability (observability) of positive discrete-time linear systems is proposed. Conditions are established under which the unreachable pair $(A, B)$ and the unobservable pair $(A, C)$ of positive discrete-time system can be decomposed into reachable and unreachable parts and observable and unobservable parts, respectively. It is shown that the transfer matrix of the positive system is equal to the transfer matrix of its reachable (observable) part.

Key words: decomposition, positive linear, discrete-time, reachability, observability

## 1. Introduction

In positive systems inputs, state variables and outputs take only non-negative values. Examples of positive systems are industrial processes involving chemical reactors, heat exchangers and distillation columns, storage systems, compartmental systems, water and atmospheric pollution models. A variety of models having positive linear behavior can be found in engineering, management science, economics, social sciences, biology and medicine, etc. An overview of state of the art in positive linear theory is given in the monographs [2,3]. The notions of controllability and observability and the decomposition of linear systems have been introduced by Kalman [7, 8]. Those notions are the basic concepts of the modern control theory $[1,6,9,10,5]$. They have been also extended to positive linear systems [2, 3]. In this paper the idea of Kalman's decomposition theorem will be extended to positive discrete-time linear systems. Conditions will be established for the decomposition of the pair $(A, B)$ into reachable and unreachable parts and of the pair $(A, C)$ into observable and unobservable parts.

The paper is organized as follows. In section 2 the basic definitions and theorem concerning reachability and observability of positive discrete-time linear systems are recalled. New test for checking the reachability of positive discrete-time linear systems is

[^0]proposed in section 3. The main result of the paper is given in section 4 and 5 . In section 4 the conditions for decomposition of the pair $(A, B)$ into reachable and unreachable parts are proposed and in section 5 the conditions for decomposition of the pair $(A, C)$ into observable and unobservable parts. Concluding remarks are given in section 6.

## 2. Preliminaries

The set of $n \times m$ real matrices will be denoted by $\mathfrak{R}^{n \times m}$ and $\Re^{n}:=\mathfrak{R}^{n \times 1}$. The set of $m \times n$ real matrices with nonnegative entries will be denoted by $\mathfrak{R}_{+}^{m \times n}$ and $\mathfrak{R}_{+}^{n}:=\mathfrak{R}_{+}^{n \times 1}$. The set of nonnegative integers will be denoted by $Z_{+}$and the $n \times n$ identity matrix by $I_{n}$.

Consider the linear discrete-time systems

$$
\begin{align*}
& x_{i+1}=A x_{i}+B u_{i}, \quad i \in Z_{+}  \tag{1}\\
& y_{i}=C x_{i}+D u_{i}
\end{align*}
$$

where $x_{i} \in \mathfrak{R}^{n}, u_{i} \in \mathfrak{R}^{m}, y_{i} \in \mathfrak{R}^{p}$ are the state, input and output vectors and $A \in \mathfrak{R}^{n \times n}$, $B \in \mathfrak{R}^{n \times m}, C \in \mathfrak{R}^{p \times n}, D \in \mathfrak{R}^{p \times m}$.

Definition 1 The system (1) is called (internally) positive if and only if $x_{i} \in \mathfrak{R}_{+}^{n}$, and $y_{i} \in \mathfrak{R}_{+}^{p}, i \in Z_{+}$for every $x_{0} \in \mathfrak{R}_{+}^{n}$, and any input sequence $u_{i} \in \mathfrak{R}_{+}^{m}, i \in Z_{+}$.

Theorem 1 [2,3] The system (1) is (internally) positive if and only if

$$
\begin{equation*}
A \in \mathfrak{R}_{+}^{n \times n}, B \in \mathfrak{R}_{+}^{n \times m}, C \in \mathfrak{R}_{+}^{p \times n}, D \in \mathfrak{R}_{+}^{p \times m} . \tag{2}
\end{equation*}
$$

Definition 2 The positive system (1) is called reachable in $q$ steps if there exists an input sequence $u_{i} \in \mathfrak{R}_{+}^{m}, i=0,1, \ldots, q-1$ which steers the state of the system from zero $\left(x_{0}=0\right)$ to any given final state $x_{f} \in \mathfrak{R}_{+}^{n}$ i.e. $x_{q}=x_{f}$.

Let $e_{i}, i=1, \ldots, n$ be the $i$ th column of the identity matrix $I_{n}$. A column $a e_{i}$ for $a>0$ is called the monomial column.

Theorem $2[2,3]$ The positive system (1) is reachable in $q$ steps if and only if the reachability matrix

$$
R_{q}=\left[\begin{array}{llll}
B & A B & \ldots & A^{q-1} B \tag{3}
\end{array}\right] \in \mathfrak{R}_{+}^{n \times q m}
$$

contains $n$ linearly independent monomial columns.
Theorem 3 [2,3] The positive system (1) is reachable in $q$ steps only if the matrix

$$
\left[\begin{array}{ll}
B & A \tag{4}
\end{array}\right]
$$

contains $n$ linearly independent monomial columns.
Definition 3 The positive systems (1) is called observable in q steps if it is possible to find unique initial state $x_{0} \in \mathfrak{R}_{+}^{n}$ of the system knowing its input sequence $u_{i} \in \mathfrak{R}_{+}^{m}$, $i=0,1, \ldots, q-1$ and its corresponding output sequence $y_{i} \in \mathfrak{R}_{+}^{p}, i=0,1, \ldots, q-1$.

Theorem 4 [2,3] The positive systems (1) is observable in q steps if and only if the observability matrix

$$
O_{q}=\left[\begin{array}{c}
C  \tag{5}\\
C A \\
\vdots \\
C A^{q-1}
\end{array}\right] \in \mathfrak{R}_{+}^{q p \times n}
$$

contains $n$ linearly independent monomial rows.
Theorem 5 [2,3] The positive system (1) is observable in q steps only if the matrix

$$
\left[\begin{array}{l}
C  \tag{6}\\
A
\end{array}\right]
$$

contains $n$ linearly independent monomial rows.

## 3. New test for checking the reachability of positive linear systems

In this section a new test for checking the reachability of the pair

$$
\left.\begin{array}{l}
A=\left[\begin{array}{cc}
A_{1} & A_{2}
\end{array} \ldots \quad A_{n}\right.
\end{array}\right] \in \mathfrak{R}_{+}^{n \times n}, \quad B=\left[\begin{array}{llll}
B_{1} & B_{2} & \ldots & B_{m}
\end{array}\right] \in \mathfrak{R}_{+}^{n \times m}, ~\left[\begin{array}{c}
a_{1 i} \\
\vdots  \tag{7}\\
a_{n i}
\end{array}\right], \quad i=1, \ldots, n ; \quad B_{j}=\left[\begin{array}{c}
b_{1 j} \\
\vdots \\
b_{n j}
\end{array}\right], \quad j=1, \ldots, m ; \quad . \quad \begin{aligned}
& A_{i}=\left[\begin{array}{c}
\end{array}\right]
\end{aligned}
$$

will be proposed.
First we assume that $m=1$ and $B=B_{1}$. Let $B_{1}$ be a monomial column with positive entry $b_{i_{1}}$. In the new test for checking the reachability of the pair (7) a crucial role will play the following procedure of finding a sequence of linearly independent monomial columns (compare with [4]).

## Procedure

The monomial column $B_{1}$ with $b_{i_{1}}>0, i_{1} \in(1, \ldots, n)$ is the first element of the sequence. If the column $A_{i_{1}}\left(=A B_{i_{1}}\right)$ is monomial and linearly independent $\left(a_{i_{2} i_{1}}>0, i_{1} \neq i_{2}\right)$ then
it belongs to the sequence $B_{1}, A_{i_{1}}$. If the column is not monomial or $i_{1}=i_{2}$ it does not belong to the sequence and the procedure stops. In this case the pair (7) is not reachable. If the column $A_{i_{2}}\left(=A A_{i_{1}}=A^{2} B_{i_{1}}\right)$ is monomial and linearly independent of the columns $B_{1}$ and $A_{i_{1}}\left(a_{i_{3} i_{2}}>0, i_{3} \neq i_{2}, i_{3} \neq i_{1}\right)$ then it belongs to the sequence $B_{1}, A_{i_{1}}, A_{1_{2}}$.

Continuing the procedure we may find the sequence of linearly independent monomial columns

$$
\begin{equation*}
B_{1}, A_{i_{1}}, \ldots, A_{1_{k}} . \tag{8}
\end{equation*}
$$

The positive linear system (1) or equivalently the pair (7) is reachable in $q=n$ steps if and only if the sequence (8) contains $n$ elements $(k=n-1)$.

Therefore, the following theorem has been proposed.

Theorem 6 The single-input positive system (1) is reachable in $n$ steps if and only if using Procedure it is possible to find n linearly independent monomial columns (8) for $k=n-1$.

Example 1 Check the reachability of the pair

$$
A=\left[\begin{array}{lll}
0 & 0 & 1  \tag{9}\\
1 & 0 & 2 \\
0 & 2 & 0
\end{array}\right], \quad B=\left[\begin{array}{l}
1 \\
0 \\
0
\end{array}\right]
$$

For the pair (9) the sequence (8) has the form

$$
B_{1}=\left[\begin{array}{l}
1  \tag{10}\\
0 \\
0
\end{array}\right], \quad A_{i_{1}}=A_{1}=A B_{1}=\left[\begin{array}{l}
0 \\
1 \\
0
\end{array}\right], \quad A_{i_{2}}=A_{2}=A^{2} B_{1}=\left[\begin{array}{l}
0 \\
0 \\
2
\end{array}\right]
$$

The sequence (10) contains three linearly independent monomial columns and the pair by Theorem 6 is reachable in $q=n=3$ steps.

Example 2 Check the reachability of the pair

$$
A=\left[\begin{array}{lll}
0 & 0 & 0  \tag{11}\\
1 & 1 & 0 \\
2 & 0 & 1
\end{array}\right], \quad B=\left[\begin{array}{l}
1 \\
0 \\
0
\end{array}\right]
$$

Note that the pair satisfies the necessary condition of reachability (Theorem 3). In this case the sequence (8) for the pair (11) contains only one monomial column $B_{1}=\left[\begin{array}{l}1 \\ 0 \\ 0\end{array}\right]$
since the column $A_{1}=A B_{1}=\left[\begin{array}{l}0 \\ 1 \\ 2\end{array}\right]$ is not monomial. Therefore, the pair is not reachable.

If $m>1$ then using Procedure sequentially for each linearly independent monomial column of the matrix $B$ we may find the sequence of the linearly independent monomial columns

$$
\begin{equation*}
B_{1}, A_{i_{11}}^{(1)}, \ldots, A_{i_{1 k_{1}}}^{(1)}, B_{2}, A_{i_{21}}^{(2)}, \ldots, A_{i_{2 k_{2}}}^{(2)}, \ldots, B_{m}, A_{i_{m 1}}^{(m)}, \ldots, A_{i_{m k_{m}}}^{(m)} . \tag{12}
\end{equation*}
$$

The positive linear systems (1) for $m>1$ is reachable in $q$ steps $(q \leqslant n)$ if and only if the sequence (12) contains $n$ linearly independent columns for $k_{i} \leqslant q, i=1, \ldots, m$.

Therefore, the following theorem has been proved.
Theorem 7 The multi-input positive system (1) is reachable in q steps $(q \leqslant n)$ if and only if using Procedure it is possible to find $n$ linearly independent monomial columns (12) for $k_{i} \leqslant q, i=1, \ldots, m$.

Example 3 Check the reachability of the pair

$$
A=\left[\begin{array}{llll}
0 & 1 & 0 & 0  \tag{13}\\
1 & 0 & 0 & 1 \\
0 & 2 & 0 & 2 \\
0 & 0 & 1 & 1
\end{array}\right], \quad B=\left[\begin{array}{ll}
1 & 0 \\
0 & 0 \\
0 & 1 \\
0 & 0
\end{array}\right]
$$

For the first monomial column of the matrix $B$ we have

$$
B_{1}=\left[\begin{array}{l}
1  \tag{14}\\
0 \\
0 \\
0
\end{array}\right], \quad A_{1}=\left[\begin{array}{l}
0 \\
1 \\
0 \\
0
\end{array}\right], \quad A_{2}=\left[\begin{array}{l}
1 \\
0 \\
2 \\
0
\end{array}\right]
$$

The first two columns of (14) are only linearly independent monomial columns. For the second monomial column of the matrix $B$ we obtain also only two linearly independent monomial columns

$$
B_{2}=\left[\begin{array}{l}
0  \tag{15}\\
0 \\
1 \\
0
\end{array}\right], \quad A_{3}=\left[\begin{array}{l}
0 \\
0 \\
0 \\
1
\end{array}\right], \quad A_{4}=\left[\begin{array}{l}
0 \\
1 \\
2 \\
1
\end{array}\right]
$$

In this case the sequence (12) has the form

$$
B_{1}=\left[\begin{array}{l}
1  \tag{16}\\
0 \\
0 \\
0
\end{array}\right], \quad A_{1}=\left[\begin{array}{l}
0 \\
1 \\
0 \\
0
\end{array}\right], \quad B_{2}=\left[\begin{array}{l}
0 \\
0 \\
1 \\
0
\end{array}\right], \quad A_{3}=\left[\begin{array}{l}
0 \\
0 \\
0 \\
1
\end{array}\right]
$$

By Theorem 7 the positive system with (13) is reachable in $q=2$ steps.

## 4. Decomposition of positive pair $(A, B)$

Let the pair $(A, B)$ of the positive systems (1) be unreachable but the sequence (12) contains at least one monomial column. First we shall consider the single-input ( $m=$ 1) system and we shall assume that the matrix $B \in \mathfrak{R}_{+}^{n \times m}$ is monomial, otherwise the positive system is unreachable for any matrix $A \in \mathfrak{R}_{+}^{n \times n}$.

Let us assume that the reachability matrix

$$
R_{n}=\left[\begin{array}{llll}
B & A B & \ldots & A^{n-1} B \tag{17}
\end{array}\right] \in \mathfrak{R}_{+}^{n \times n}
$$

of the positive system (1) has $n_{1}<n$ linearly independent monomial columns

$$
\begin{equation*}
P_{1}=B, \quad P_{2}=A B, \quad P_{n_{1}}=A^{n_{1}-1} B . \tag{18}
\end{equation*}
$$

It is always possible to chose $n_{2}=n-n_{1}$ linearly independent monomial columns

$$
\begin{equation*}
P_{n_{1}+1}, P_{n_{1}+2}, \ldots, P_{n} \tag{19}
\end{equation*}
$$

which are orthogonal to the columns (18). The matrix

$$
P=\left[\begin{array}{llllll}
P_{1} & \ldots & P_{n_{1}} & P_{n_{1}+1} & \ldots & P_{n} \tag{20}
\end{array}\right]
$$

is monomial and its inverse $P^{-1}$ is equal to $P^{T}$, where $T$ denotes the transpose.
It is assumed that the following condition

$$
\begin{equation*}
P_{k}^{T} A P_{n_{1}}=0 \quad \text { and } k=n_{1}+1, \ldots, n \tag{21}
\end{equation*}
$$

is satisfied. Note that (21) holds if $A P_{n_{1}}$ is a linear combination of the monomial columns $P_{1}, \ldots, P_{n_{1}}$. We shall show that if the condition (21) is satisfied then using the matrix (20) we can reduce the pair $(A, B)$ to the following form

$$
\bar{A}=P^{-1} A P=\left[\begin{array}{cc}
\bar{A}_{1} & \bar{A}_{12}  \tag{22}\\
0 & \bar{A}_{2}
\end{array}\right], \quad \bar{B}=P^{-1} B=\left[\begin{array}{c}
\bar{B}_{1} \\
0
\end{array}\right]
$$

where the pair

$$
\begin{equation*}
\bar{A}_{1} \in \mathfrak{R}_{+}^{n_{1} \times n_{1}}, \quad \bar{B}_{1} \in \mathfrak{R}_{+}^{n_{1}} \tag{23}
\end{equation*}
$$

is reachable and the pair $\bar{A}_{2} \in \operatorname{Re}_{+}^{n_{2} \times n_{2}}, \bar{B}_{2}=0 \in \operatorname{Re}_{+}^{n_{2}}$ is unreachable.
From (18) we have

$$
\begin{equation*}
A P=\left[A P_{1} A P_{2} \ldots A P_{n_{1}} A P_{n_{1}+1} \ldots A P_{n}\right]=\left[P_{2} P_{3} \ldots P_{n_{1}} A P_{n_{1}} \ldots A P_{n}\right] \tag{24}
\end{equation*}
$$

Taking into account that (18) are orthogonal to (19) and using (24) we obtain

$$
P^{-1} A P=P^{T} A P=\left[\begin{array}{c}
P_{1}^{T}  \tag{25a}\\
\vdots \\
P_{n_{1}}^{T} \\
P_{n_{1}+1}^{T} \\
\vdots \\
P_{n}^{T}
\end{array}\right]\left[P_{2} P_{3} \ldots P_{n_{1}} A P_{n_{1}} \ldots A P_{n}\right]=\left[\begin{array}{cc}
\bar{A}_{1} & \bar{A}_{12} \\
0 & \bar{A}_{2}
\end{array}\right]
$$

where

$$
\begin{align*}
& \bar{A}_{1}=\left[\begin{array}{cccc}
P_{1}^{T} P_{2} & \ldots & P_{1}^{T} P_{n_{1}} & P_{1}^{T} A P_{n_{1}} \\
\vdots & \ldots & \vdots & \vdots \\
P_{n_{1}}^{T} P_{2} & \ldots & P_{n_{1}}^{T} P_{n_{1}} & P_{n_{1}}^{T} A P_{n_{1}}
\end{array}\right]=\left[\begin{array}{ccccc}
0 & 0 & \ldots & 0 & \bar{a}_{1} \\
1 & 0 & \ldots & 0 & \bar{a}_{2} \\
0 & 1 & \ldots & 0 & \bar{a}_{3} \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
0 & 0 & \ldots & 1 & \bar{a}_{n_{1}}
\end{array}\right] \in \mathfrak{R}_{+}^{n_{1} \times n_{1}}, \\
& \bar{a}_{k}=P_{k}^{T} A P_{n_{1}}, \quad k=1, \ldots, n_{1} ; \\
& \bar{A}_{12}=\left[\begin{array}{cccc}
P_{1}^{T} A P_{n_{1}+1} & \ldots & P_{1}^{T} A P_{n-1} & P_{1}^{T} A P_{n} \\
\vdots & \ldots & \vdots & \vdots \\
P_{n_{1}}^{T} A P_{n_{1}+1} & \ldots & P_{n_{1}}^{T} A P_{n-1} & P_{n_{1}}^{T} A P_{n}
\end{array}\right] \in \mathfrak{R}_{+}^{n_{1} \times n_{2}},  \tag{25b}\\
& \bar{A}_{2}=\left[\begin{array}{cccc}
P_{n_{1}+1}^{T} A P_{n_{1}+1} & \ldots & P_{n_{1}+1}^{T} A P_{n-1} & P_{n_{1}+1}^{T} A P_{n} \\
\vdots & \ldots & \vdots & \vdots \\
P_{n}^{T} A P_{n_{1}+1} & \ldots & P_{n}^{T} A P_{n-1} & P_{n}^{T} A P_{n}
\end{array}\right] \in \mathfrak{R}_{+}^{n_{2} \times n_{2}}
\end{align*}
$$

and

$$
\left[\begin{array}{cccc}
P_{n_{1}+1}^{T} P_{2} & \ldots & P_{n_{1}+1}^{T} P_{n_{1}} & P_{n_{1}+1}^{T} A P_{n_{1}}  \tag{25c}\\
\vdots & \ldots & \vdots & \vdots \\
P_{n}^{T} P_{2} & \ldots & P_{n}^{T} P_{n_{1}} & P_{n}^{T} A P_{n_{1}}
\end{array}\right]=\left[\begin{array}{ccc}
0 & \ldots & 0 \\
\vdots & \ldots & \vdots \\
0 & \ldots & 0
\end{array}\right] \in \mathfrak{R}^{n_{2} \times n_{1}}
$$

since (21) holds. Taking into account that

$$
P_{k}^{T} B=\left\{\begin{array}{lll}
1 & \text { for } & k=1  \tag{26}\\
0 & \text { for } & k=2, \ldots, n
\end{array}\right.
$$

we obtain

$$
\bar{B}=P^{-1} B=P^{T} B=\left[\begin{array}{c}
P_{1}^{T}  \tag{27}\\
\vdots \\
P_{n}^{T}
\end{array}\right] B=\left[\begin{array}{c}
1 \\
0 \\
\vdots \\
0
\end{array}\right]=\left[\begin{array}{c}
\bar{B}_{1} \\
0
\end{array}\right] .
$$

Using (25) and (27) it is easy to verify that the pair $\left(\bar{A}_{1}, \bar{B}_{1}\right)$ is reachable since

$$
\left[\begin{array}{llll}
\bar{B}_{1} & \bar{A}_{1} \bar{B}_{1} & \ldots & \bar{A}_{1}^{n_{1}-1} \bar{B}_{1} \tag{28}
\end{array}\right]=I_{n_{1}} .
$$

Therefore the following theorem has been proved.
Theorem 8 Let the positive system (1) be unreachable but the matrix (17) has $n_{1}$ linearly independent monomial columns and the assumption (21) be satisfied. Then the pair $(A, B)$ of the system can be reduced to the form (22) by the use of the similarity transformation with monomial matrix (20). Moreover, the positive pair $\left(\bar{A}_{1}, \bar{B}_{1}\right)$ is reachable.

Example 4 Consider the positive system (1) with the matrices

$$
A=\left[\begin{array}{llll}
0 & 0 & 0 & 2  \tag{29}\\
1 & 0 & 1 & 0 \\
2 & 1 & 0 & 1 \\
0 & 0 & 0 & 1
\end{array}\right], \quad B=\left[\begin{array}{l}
0 \\
1 \\
0 \\
0
\end{array}\right]
$$

The pair is unreachable since the reachability matrix

$$
R_{4}=\left[\begin{array}{llll}
B & A B & A^{2} B & A^{3} B
\end{array}\right]=\left[\begin{array}{cccc}
0 & 0 & 0 & 0  \tag{30}\\
1 & 0 & 1 & 0 \\
0 & 1 & 0 & 1 \\
0 & 0 & 0 & 0
\end{array}\right]
$$

has only two linearly independent monomial columns $P_{1}=B$ and $P_{2}=A B$. In this case the monomial matrix (20) has the form

$$
P=\left[\begin{array}{llll}
P_{1} & P_{2} & P_{3} & P_{4}
\end{array}\right]=\left[\begin{array}{cccc}
0 & 0 & 1 & 0  \tag{31}\\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]
$$

and the assumption (21) is satisfied since

$$
\left[\begin{array}{c}
P_{3}^{T}  \tag{32}\\
P_{4}^{T}
\end{array}\right] A P_{2}=\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{llll}
0 & 0 & 0 & 2 \\
1 & 0 & 1 & 0 \\
2 & 1 & 0 & 1 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{l}
0 \\
0 \\
1 \\
0
\end{array}\right]=\left[\begin{array}{l}
0 \\
0
\end{array}\right]
$$

Using (22) we obtain

$$
\begin{align*}
\bar{A}=P^{-1} A P & =\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{llll}
0 & 0 & 0 & 2 \\
1 & 0 & 1 & 0 \\
2 & 1 & 0 & 1 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]=  \tag{33}\\
& =\left[\begin{array}{llll}
0 & 1 & 1 & 0 \\
1 & 0 & 2 & 1 \\
0 & 0 & 0 & 2 \\
0 & 0 & 0 & 1
\end{array}\right]=\left[\begin{array}{cc}
\bar{A}_{1} & \bar{A}_{12} \\
0 & \bar{A}_{2}
\end{array}\right]
\end{align*}
$$

and

$$
\bar{B}=P^{-1} B=\left[\begin{array}{cccc}
0 & 1 & 0 & 0  \tag{3}\\
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{l}
0 \\
1 \\
0 \\
0
\end{array}\right]=\left[\begin{array}{l}
1 \\
0 \\
0 \\
0
\end{array}\right]=\left[\begin{array}{c}
\bar{B}_{1} \\
0
\end{array}\right]
$$

The pair

$$
\bar{A}_{1}=\left[\begin{array}{ll}
0 & 1  \tag{35}\\
1 & 0
\end{array}\right], \quad \bar{B}_{1}=\left[\begin{array}{l}
1 \\
0
\end{array}\right]
$$

is reachable since $\left[\begin{array}{cc}\bar{B}_{1} & \bar{A}_{1} \bar{B}_{1}\end{array}\right]=\left[\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right]$.
Example 5 Consider the positive system (1) with the matrices

$$
A=\left[\begin{array}{llll}
0 & 0 & 1 & 2  \tag{36}\\
1 & 0 & 0 & 0 \\
2 & 1 & 0 & 1 \\
0 & 0 & 1 & 0
\end{array}\right], \quad B=\left[\begin{array}{l}
0 \\
1 \\
0 \\
0
\end{array}\right]
$$

The pair is unreachable since the reachability matrix

$$
R_{4}=\left[\begin{array}{llll}
B & A B & A^{2} B & A^{3} B
\end{array}\right]=\left[\begin{array}{cccc}
0 & 0 & 1 & 2  \tag{37}\\
1 & 0 & 0 & 1 \\
0 & 1 & 0 & 3 \\
0 & 0 & 1 & 0
\end{array}\right]
$$

has only two linearly independent monomial columns $P_{1}=B$ and $P_{2}=A B$. In this case the monomial matrix (20) has also the form (31) but the assumption (21) is not satisfied since

$$
\left[\begin{array}{c}
P_{3}^{T}  \tag{38}\\
P_{4}^{T}
\end{array}\right] A P_{2}=\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{llll}
0 & 0 & 1 & 2 \\
1 & 0 & 0 & 0 \\
2 & 1 & 0 & 1 \\
0 & 0 & 1 & 0
\end{array}\right]\left[\begin{array}{l}
0 \\
0 \\
1 \\
0
\end{array}\right]=\left[\begin{array}{l}
1 \\
1
\end{array}\right]
$$

Using (22) we obtain

$$
\begin{align*}
\bar{A}=P^{-1} A P & =\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{llll}
0 & 0 & 1 & 2 \\
1 & 0 & 0 & 0 \\
2 & 1 & 0 & 1 \\
0 & 0 & 1 & 0
\end{array}\right]\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]=  \tag{39}\\
& =\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
1 & 0 & 2 & 1 \\
0 & 1 & 0 & 2 \\
0 & 1 & 0 & 0
\end{array}\right]
\end{align*}
$$

and

$$
\bar{B}=P^{-1} B=\left[\begin{array}{cccc}
0 & 1 & 0 & 0  \tag{40}\\
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{l}
0 \\
1 \\
0 \\
0
\end{array}\right]=\left[\begin{array}{l}
1 \\
0 \\
0 \\
0
\end{array}\right]
$$

In this case the matrices (39) and ((40) has not the form (22).
Now let us consider the multi-input ( $m>1$ ) positive system (1). We shall assume that the matrix $B \in \mathfrak{R}_{+}^{n \times m}$ has at least one monomial column; otherwise the positive system is not reachable for any matrix $A \in \mathfrak{R}_{+}^{n \times n}$. Let the reachability matrix

$$
R_{n}=\left[\begin{array}{llll}
B & A B & \ldots & A^{n-1} B \tag{41}
\end{array}\right] \in \mathfrak{R}_{+}^{n \times m n}
$$

has $n_{1}<n$ linearly independent monomial columns

$$
\begin{equation*}
P_{1}, \quad P_{2}, \ldots, \quad P_{n_{1}} . \tag{42}
\end{equation*}
$$

The columns of (42) are chosen as follows. Let the columns $B_{i_{1}}, B_{i_{2}}, \ldots, B_{i_{k}}(k \leqslant m)$ of the matrix $B$ are linearly independent monomial columns. We choose from the sequence

$$
\begin{equation*}
A B_{i_{1}}, \ldots, A B_{i_{k}}, A^{2} B_{i_{1}}, \ldots, A^{2} B_{i_{k}}, \ldots, A^{n-1} B_{i_{1}}, \ldots, A^{n-1} B_{i_{k}} \tag{43}
\end{equation*}
$$

such monomial columns which are linearly independent from the previously chosen monomial columns.

It is always possible to chose $n_{2}=n-n_{1}$ linearly independent monomial

$$
\begin{equation*}
P_{n_{1}+1}, P_{n_{1}+2}, \ldots, P_{n} \tag{44}
\end{equation*}
$$

which are orthogonal to the columns (42).
Let the monomial matrix $P$ have the form

$$
\begin{equation*}
P_{n_{1}+1}, P_{n_{1}+2}, \ldots, P_{n} \tag{45a}
\end{equation*}
$$

where

$$
\begin{equation*}
P_{i_{1}}=B_{i_{1}}, \ldots, P_{i_{1} d_{1}}=A^{d_{1}-1} B_{i_{1}}, P_{i_{2}}=B_{i_{2}}, \ldots, P_{i_{2} d_{2}}=A^{d_{2}-1} B_{i_{2}}, \ldots, P_{i_{k} d_{k}}=A^{d_{k}-1} B_{i_{k}} \tag{45b}
\end{equation*}
$$

and $d_{i}(i=1, \ldots, k)$ are some natural numbers. Taking into account that

$$
P^{-1}=P^{T}=\left[\begin{array}{c}
P_{1}^{T}  \tag{46}\\
\vdots \\
P_{n}^{T}
\end{array}\right] \quad \text { and } P_{i}^{T} P_{j}=\left\{\begin{array}{lll}
1 & \text { for } & i=j \\
0 & \text { for } & i \neq j
\end{array}\right.
$$

we obtain

$$
\bar{A}=P^{-1} A P=\left[\begin{array}{c}
P_{1}^{T}  \tag{47a}\\
\vdots \\
P_{n}^{T}
\end{array}\right]\left[\begin{array}{lllll}
A & P_{1} & A P_{2} & \ldots & A P_{n}
\end{array}\right]=\left[\begin{array}{cc}
\bar{A}_{1} & \bar{A}_{12} \\
0 & \bar{A}_{2}
\end{array}\right]
$$

where
$\bar{A}_{1}=\left[\begin{array}{ccc}P_{1}^{T} A P_{1} & \ldots & P_{1}^{T} A P_{n_{1}} \\ \vdots & \ldots & \vdots \\ P_{n_{1}}^{T} A P_{1} & \ldots & P_{n_{1}}^{T} A P_{n_{1}}\end{array}\right], \quad \bar{A}_{12}=\left[\begin{array}{ccc}P_{1}^{T} A P_{n_{1}+1} & \ldots & P_{1}^{T} A P_{n} \\ \vdots & \ldots & \vdots \\ P_{n_{1}}^{T} A P_{n_{1}+1} & \ldots & P_{n_{1}}^{T} A P_{n}\end{array}\right]$,
$\bar{A}_{2}=\left[\begin{array}{ccc}P_{n_{1}+1}^{T} A P_{n_{1}+1} & \ldots & P_{n_{1}+1}^{T} A P_{n} \\ \vdots & \ldots & \vdots \\ P_{n}^{T} A P_{n_{1}+1} & \ldots & P_{n}^{T} A P_{n}\end{array}\right]$
where

$$
\begin{align*}
\bar{B} & =P^{-1} B=\left[\begin{array}{c}
P_{1}^{T} \\
\vdots \\
P_{n}^{T}
\end{array}\right] B=\left[\begin{array}{c}
\bar{B}_{1} \\
0
\end{array}\right], \quad \bar{B}_{1}=\operatorname{blockdiag}\left[\begin{array}{lll}
\bar{B}_{1} & \ldots & \bar{B}_{i_{k}}
\end{array}\right]  \tag{47c}\\
B_{i} & =\left[\begin{array}{c}
1 \\
0 \\
\vdots \\
0
\end{array}\right], \quad i=i_{1}, \ldots, i_{k}
\end{align*}
$$

if

$$
\begin{equation*}
P_{k}^{T} A P_{j}=0 \text { for } k=n_{1}+1, \ldots, n ; \quad j=1, \ldots, n_{1} \tag{48}
\end{equation*}
$$

where the pair $\left(\bar{A}_{1}, \bar{B}_{1}\right)$ is reachable and the pair $\left(\bar{A}_{2}, \bar{B}_{2}=0\right)$ is unreachable. Therefore, the following theorem has been proved.

Theorem 9 Let the positive system (1) be unreachable but the matrix (41) has $n_{1}$ linearly independent monomial columns and the assumption (48) be satisfied. Then the pair $(A, B)$ of the system can be reduced to the form (47) by the use of the similarity transformation with the monomial matrix (45). Moreover the positive pair $\left(\bar{A}_{1}, \bar{B}_{1}\right)$ is reachable.

Example 6 Consider the positive system (1) with the matrices

$$
A=\left[\begin{array}{lll}
1 & 0 & 0  \tag{49}\\
0 & 1 & 1 \\
0 & 0 & 2
\end{array}\right], \quad B=\left[\begin{array}{ll}
0 & 1 \\
1 & 0 \\
0 & 1
\end{array}\right]
$$

The pair is unreachable since the reachability matrix

$$
R_{3}=\left[\begin{array}{lll}
B & A B & A^{2} B
\end{array}\right]=\left[\begin{array}{cccccc}
0 & 1 & 0 & 1 & 0 & 1  \tag{50}\\
1 & 0 & 1 & 1 & 1 & 3 \\
0 & 1 & 0 & 2 & 0 & 4
\end{array}\right]
$$

has only one monomial column $P_{1}=\left[\begin{array}{l}0 \\ 1 \\ 0\end{array}\right]$. In this case the monomial matrix (45) has the form

$$
P=\left[\begin{array}{lll}
0 & 1 & 0  \tag{51a}\\
1 & 0 & 0 \\
0 & 0 & 1
\end{array}\right]
$$

and the assumption (48) is satisfied since

$$
\left[\begin{array}{l}
P_{2}^{T}  \tag{51b}\\
P_{3}^{T}
\end{array}\right] A P_{1}=\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 0 & 1
\end{array}\right]\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 1 \\
0 & 0 & 2
\end{array}\right]\left[\begin{array}{l}
0 \\
1 \\
0
\end{array}\right]=\left[\begin{array}{l}
0 \\
0
\end{array}\right]
$$

Using (47), (49) and (51a) we obtain

$$
\begin{align*}
\bar{A}=P^{-1} A P & =\left[\begin{array}{lll}
0 & 1 & 0 \\
1 & 0 & 0 \\
0 & 0 & 1
\end{array}\right]\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 1 \\
0 & 0 & 2
\end{array}\right]\left[\begin{array}{lll}
0 & 1 & 0 \\
1 & 0 & 0 \\
0 & 0 & 1
\end{array}\right]=\left[\begin{array}{lll}
1 & 0 & 1 \\
0 & 1 & 0 \\
0 & 0 & 2
\end{array}\right]=  \tag{52a}\\
& =\left[\begin{array}{cc}
\bar{A}_{1} & \bar{A}_{12} \\
0 & \bar{A}_{2}
\end{array}\right]
\end{align*}
$$

and

$$
\bar{B}=P^{-1} B=\left[\begin{array}{ccc}
0 & 1 & 0  \tag{52b}\\
1 & 0 & 0 \\
0 & 0 & 1
\end{array}\right]\left[\begin{array}{ll}
0 & 1 \\
1 & 0 \\
0 & 1
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1 \\
0 & 1
\end{array}\right]=\left[\begin{array}{cc}
\bar{B}_{1} & 0 \\
0 & \bar{B}_{2}
\end{array}\right]
$$

The positive pair $\bar{A}_{1}=[1], \bar{B}_{1}=[1]$ is reachable and the positive pair $\bar{A}_{2}=\left[\begin{array}{ll}1 & 0 \\ 0 & 2\end{array}\right]$, $\bar{B}_{2}=\underset{\text { Let }}{\left[\begin{array}{l}1 \\ 1\end{array}\right] \text { is unreachable since }\left[\begin{array}{ll}\bar{B}_{2} & \bar{A}_{2} \bar{B}_{2}\end{array}\right]=\left[\begin{array}{ll}1 & 1 \\ 1 & 2\end{array}\right] . ~}$

$$
\bar{x}_{i}=P^{-1} x_{i}=\left[\begin{array}{c}
\bar{x}_{i}^{(1)}  \tag{53}\\
\bar{x}_{i}^{(2)}
\end{array}\right], \quad \bar{x}_{i}^{(1)} \in \mathfrak{R}^{n_{1}}, \quad \bar{x}_{i}^{(2)} \in \mathfrak{R}^{n_{2}}
$$

be a new state vector and

$$
\begin{equation*}
y_{i}=C x_{i}+D u_{i}=C P P^{-1} x_{i}+D u_{i}=\bar{C}_{1} \bar{x}_{i}^{(1)}+\bar{C}_{2} \bar{x}_{i}^{(2)}+D u_{i} \tag{54}
\end{equation*}
$$

where

$$
C P=\left[\begin{array}{ll}
\bar{C}_{1} & \bar{C}_{2} \tag{55}
\end{array}\right], \quad \bar{C}_{1} \in \Re^{p \times n_{1}}, \quad \bar{C}_{2} \in \mathfrak{R}^{p \times n_{2}} .
$$

Definition 4 The positive subsystem

$$
\begin{align*}
& \bar{x}_{i}^{(1)}=\bar{A}_{1} \bar{x}_{i}^{(1)}+\bar{B}_{1} u_{i}  \tag{56a}\\
& y_{i}^{(1)}=\bar{C}_{1} \bar{x}_{i}^{(1)}+D u_{i} \tag{56b}
\end{align*}
$$

is called the reachable part of the system (1).

Theorem 10 The transfer matrix of the positive system (1)

$$
\begin{equation*}
T(z)=C\left[I_{n} z-A\right]^{-1} B+D \tag{57}
\end{equation*}
$$

is equal to the transfer matrix of its reachable part (56)

$$
\begin{equation*}
T_{1}(z)=\bar{C}_{1}\left[I_{n_{1}} z-\bar{A}_{1}\right]^{-1} \bar{B}_{1}+D \tag{58}
\end{equation*}
$$

i.e. $T(z)=T_{1}(z)$.

Proof Using (57), (22) and (55) we obtain

$$
\begin{align*}
T(z) & =C\left[I_{n} z-A\right]^{-1} B+D=C P P^{-1}\left[I_{n} z-A\right]^{-1} P P^{-1} B+D \\
& =\bar{C}\left[I_{n} z-P A P^{-1}\right]^{-1} \bar{B}+D=\left[\begin{array}{ll}
\bar{C}_{1} & \bar{C}_{2}
\end{array}\right]\left[\begin{array}{cc}
I_{n_{1}} z-\bar{A}_{1} & -\bar{A}_{12} \\
0 & I_{n_{2}} z-\bar{A}_{2}
\end{array}\right]^{-1}\left[\begin{array}{c}
\bar{B}_{1} \\
0
\end{array}\right]+D \\
& =\left[\begin{array}{ll}
\bar{C}_{1} & \bar{C}_{2}
\end{array}\right]\left[\begin{array}{cc}
{\left[I_{n_{1}} z-\bar{A}_{1}\right]^{-1}} & * \\
0 & {\left[I_{n_{2}} z-\bar{A}_{2}\right]^{-1}}
\end{array}\right]\left[\begin{array}{c}
\bar{B}_{1} \\
0
\end{array}\right]+D  \tag{59}\\
& =\bar{C}_{1}\left[I_{n_{1}} z-\bar{A}_{1}\right]^{-1} \bar{B}_{1}+D=T_{1}(z) .
\end{align*}
$$

Therefore, the transfer matrix (58) represents only reachable part of the positive system.

## 5. Decomposition of the positive pair $(A, C)$

Definition 5 The positive system

$$
\begin{align*}
& x_{i+1}=A^{T} x_{i}+C^{T} u_{i}, \quad i \in Z_{+}  \tag{60}\\
& y_{i}=B^{T} x_{i}+D u_{i}
\end{align*}
$$

(the matrices $A, B, C, D$ are the same as of (1)) is called the dual positive system with respect to the system (1).

Theorem 11 The positive system (1) is reachable in $q$ steps if and only if the positive dual system (60) is observable in q steps.

Proof By Theorem 2 the positive system (1) is reachable in $q$ steps if and only if the reachability matrix

$$
R_{q}=\left[\begin{array}{llll}
B & A B & \ldots & A^{q-1} B \tag{61}
\end{array}\right]
$$

contains $n$ linearly independent monomial columns. Note that the transpose matrix (61)

$$
R_{q}^{T}=\left[\begin{array}{c}
B^{T}  \tag{62}\\
B^{T} A^{T} \\
\vdots \\
B^{T}\left(A^{T}\right)^{q-1}
\end{array}\right]
$$

contains $n$ linearly independent monomial rows if and only if the matrix (61) contains $n$ linearly independent monomial columns.

The matrix (62) is the observability matrix of the positive system (60). By Theorem 4 the positive system (60) is observable in $q$ steps if and only if the positive system (1) is reachable in $q$ steps.

Therefore, for testing the observability of the positive system (1) we can use the reachability conditions for dual positive system. The duality can be also used in the decomposition of the positive pair $(A, C)$. Let the pair $(A, C)$ of the positive single-output ( $p=1$ ) system (1) be unobservable but the matrix $C$ be a monomial (otherwise the system is unobservable for any matrix $A \in \mathfrak{R}_{+}^{n \times n}$ ).

Let us assume that the observability matrix

$$
O_{n}=\left[\begin{array}{c}
C  \tag{63}\\
C A \\
\vdots \\
C A^{n-1}
\end{array}\right] \in \mathfrak{R}_{+}^{n \times n}
$$

has $n_{1}<n$ linearly independent monomial rows

$$
\begin{equation*}
Q_{1}=C, \quad Q_{2}=C A, \quad \ldots, \quad Q_{n_{1}}=C A^{n_{1}-1} . \tag{64}
\end{equation*}
$$

It is always possible to choose $n_{2}=n-n_{1}$ linearly independent monomial rows

$$
\begin{equation*}
Q_{n_{1}+1}, \quad Q_{n_{1}+2}, \ldots, Q_{n} \tag{65}
\end{equation*}
$$

which are orthogonal to the rows (64). The matrix

$$
Q=\left[\begin{array}{c}
Q_{1}  \tag{66}\\
\vdots \\
Q_{n_{1}} \\
Q_{n_{1}+1} \\
\vdots \\
Q_{n}
\end{array}\right]
$$

is monomial and its inverse $Q^{-1}=Q^{T}$. We shall show that if

$$
\begin{equation*}
Q_{n_{1}} A Q_{k}^{T}=0 \text { for } k=n_{1}+1, \ldots, n \tag{67}
\end{equation*}
$$

holds then using (66) we can reduce the pair $(A, C)$ to the from

$$
\hat{A}=Q A Q^{-1}=\left[\begin{array}{cc}
\hat{A}_{1} & 0  \tag{68}\\
\hat{A}_{21} & \hat{A}_{2}
\end{array}\right], \quad \hat{C}=C Q^{-1}=\left[\begin{array}{ll}
\hat{C}_{1} & 0
\end{array}\right]
$$

where the pair $\left(\hat{A}_{1}, \hat{C}_{1}\right)$ is observable and the pair $\left(\hat{A}_{2}, \hat{C}_{2}=0\right)$ is unobservable.
From (64) we have

$$
Q A=\left[\begin{array}{c}
Q_{1} A  \tag{69}\\
Q_{2} A \\
\vdots \\
Q_{n_{1}-1} A \\
Q_{n_{1}} A \\
\vdots \\
Q_{n} A
\end{array}\right]=\left[\begin{array}{c}
Q_{2} \\
Q_{3} \\
\vdots \\
Q_{n_{1}} \\
Q_{n_{1}} A \\
\vdots \\
Q_{n} A
\end{array}\right] .
$$

Taking into account that (65) are orthogonal to (64) and using (67) we obtain

$$
\hat{A}=Q A Q^{T}=\left[\begin{array}{c}
Q_{2}  \tag{70}\\
Q_{3} \\
\vdots \\
Q_{n_{1}} \\
Q_{n_{1}} A \\
\vdots \\
Q_{n} A
\end{array}\right]\left[\begin{array}{llllll}
Q_{1}^{T} & Q_{2}^{T} & \ldots & Q_{n_{1}}^{T} & \ldots & Q_{n}^{T}
\end{array}\right]=\left[\begin{array}{cc}
\hat{A}_{1} & 0 \\
\hat{A}_{21} & \hat{A}_{2}
\end{array}\right]
$$

where

$$
\begin{align*}
& \hat{A}_{1}=\left[\begin{array}{ccc}
Q_{2} Q_{1}^{T} & \ldots & Q_{2} Q_{n_{1}}^{T} \\
\vdots & \ldots & \vdots \\
Q_{n_{1}} A Q_{1}^{T} & \ldots & Q_{n_{1}} A Q_{n_{1}}^{T}
\end{array}\right]=\left[\begin{array}{ccccc}
0 & 1 & 0 & \ldots & 0 \\
0 & 0 & 1 & \ldots & 0 \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
0 & 0 & 0 & \ldots & 1 \\
\hat{a}_{1} & \hat{a}_{2} & \hat{a}_{3} & \ldots & \hat{a}_{n_{1}}
\end{array}\right] \in \mathfrak{R}_{+}^{n_{1} \times n_{1}}, \\
& \hat{a}_{k}=Q_{n_{1}} A Q_{k}^{T}, \quad k=1, \ldots, n_{1} ; \\
& \hat{A}_{21}=\left[\begin{array}{ccc}
Q_{n_{1}+1} A Q_{1}^{T} & \ldots & Q_{n_{1}+1} A Q_{n_{1}}^{T} \\
\vdots & \ldots & \vdots \\
Q_{n} A Q_{1}^{T} & \ldots & Q_{n} A Q_{n_{1}}^{T}
\end{array}\right] \in \mathfrak{R}_{+}^{n_{2} \times n_{1}},  \tag{71}\\
& \hat{A}_{2}=\left[\begin{array}{ccc}
Q_{n_{1}+1} A Q_{n_{1}+1}^{T} & \ldots & Q_{n_{1}+1} A Q_{n}^{T} \\
\vdots & \ldots & \vdots \\
Q_{n} A Q_{n_{1}+1}^{T} & \ldots & Q_{n} A Q_{n}^{T}
\end{array}\right] \in \mathfrak{R}_{+}^{n_{2} \times n_{2}} .
\end{align*}
$$

Taking into account that

$$
C Q_{k}^{T}=\left\{\begin{array}{llc}
1 & \text { for } & k=1  \tag{72}\\
0 & \text { for } & k=2, \ldots, n
\end{array}\right.
$$

we obtain

$$
\hat{C}=C Q^{T}=\left[\begin{array}{ll}
\hat{C}_{1} & 0
\end{array}\right], \quad \hat{C}_{1}=\left[\begin{array}{llll}
1 & 0 & \ldots & 0 \tag{73}
\end{array}\right] \in \mathfrak{R}_{+}^{1 \times n_{1}} .
$$

Using (71) and (73) it is easy to verify that the pair $\left(\hat{A}_{1}, \hat{B}_{1}\right)$ is observable since

$$
\left[\begin{array}{c}
\hat{C}_{1}  \tag{74}\\
\hat{C}_{1} \hat{A}_{1} \\
\vdots \\
\hat{C}_{1} \hat{A}_{1}^{n-1}
\end{array}\right]=I_{n_{1}}
$$

Therefore, the following theorem has been proved.
Theorem 12 Let the positive system (1) be unobservable but the matrix (63) has $n_{1}$ linearly independent monomial rows and the assumption (67) be satisfied. Then the pair $(A, C)$ of the system can be reduced to the form (68) by the use of the similarity transformation with monomial matrix (66). Moreover, the positive pair $\left(\hat{A}_{1}, \hat{C}_{1}\right)$ is observable.

Example 7 Consider the positive system (1) with the matrices

$$
A=\left[\begin{array}{llll}
0 & 1 & 2 & 0  \tag{75}\\
0 & 0 & 1 & 0 \\
0 & 1 & 0 & 0 \\
2 & 0 & 1 & 1
\end{array}\right], \quad C=\left[\begin{array}{llll}
0 & 1 & 0 & 0
\end{array}\right]
$$

The pair is unobservable since the observability matrix

$$
O_{4}=\left[\begin{array}{c}
C  \tag{76}\\
C A \\
C A^{2} \\
C A^{3}
\end{array}\right]=\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0
\end{array}\right]
$$

has only two linearly independent monomial rows $\left(n_{1}=2\right) Q_{1}=C$ and $Q_{2}=C A$. In this case the monomial matrix (66) has the form

$$
Q=\left[\begin{array}{l}
Q_{1}  \tag{77}\\
Q_{2} \\
Q_{3} \\
Q_{4}
\end{array}\right]=\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]
$$

and the assumption (67) is satisfied since

$$
Q_{2} A\left[\begin{array}{ll}
Q_{3}^{T} & Q_{4}^{T}
\end{array}\right]=\left[\begin{array}{llll}
0 & 0 & 1 & 0
\end{array}\right]\left[\begin{array}{llll}
0 & 1 & 2 & 0  \tag{78}\\
0 & 0 & 1 & 0 \\
0 & 1 & 0 & 0 \\
2 & 0 & 1 & 1
\end{array}\right]\left[\begin{array}{ll}
1 & 0 \\
0 & 0 \\
0 & 0 \\
0 & 1
\end{array}\right]=\left[\begin{array}{ll}
0 & 0
\end{array}\right]
$$

Using (68) and (77) we obtain

$$
\begin{align*}
\hat{A}=Q A Q^{T} & =\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]\left[\begin{array}{llll}
0 & 1 & 2 & 0 \\
0 & 0 & 1 & 0 \\
0 & 1 & 0 & 0 \\
2 & 0 & 1 & 1
\end{array}\right]\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]  \tag{79a}\\
& =\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
1 & 0 & 0 & 0 \\
1 & 2 & 0 & 0 \\
0 & 1 & 2 & 1
\end{array}\right]=\left[\begin{array}{ll}
\hat{A}_{1} & 0 \\
\hat{A}_{21} & \hat{A}_{2}
\end{array}\right]
\end{align*}
$$

and

$$
\hat{C}=C Q^{T}=\left[\begin{array}{llll}
0 & 1 & 0 & 0
\end{array}\right]\left[\begin{array}{cccc}
0 & 0 & 1 & 0  \tag{79b}\\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]=\left[\begin{array}{llll}
1 & 0 & 0 & 0
\end{array}\right]=\left[\begin{array}{ll}
\hat{C}_{1} & 0
\end{array}\right]
$$

The pair

$$
\hat{A}_{1}=\left[\begin{array}{ll}
0 & 1  \tag{80a}\\
1 & 0
\end{array}\right], \quad \hat{C}_{1}=\left[\begin{array}{ll}
1 & 0
\end{array}\right]
$$

is observable since

$$
\left[\begin{array}{c}
\hat{C}_{1}  \tag{80b}\\
\hat{C}_{1} \hat{A}_{1}
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]
$$

Note that the pair (75) is the dual pair to (29) and the results can be obtained by the duality principle.

In a similar way the considerations can be extended for the multi-input $(p>1)$ positive systems (1).

Let the observability matrix (63) has $n_{1}<n$ linearly independent monomial rows and the rows $C_{j_{1}}, C_{j_{2}}, \ldots, C_{j_{l}}(l \leqslant p)$ of the matrix $C \in \mathfrak{R}_{+}^{p \times n}$ are linearly independent monomial rows. Then from the sequence

$$
\begin{equation*}
C_{j_{1}} A, \ldots, C_{j_{l}} A, C_{j_{1}} A^{2}, \ldots, C_{j_{l}} A^{2}, \ldots, C_{j_{1}} A^{n-1}, \ldots, C_{j_{l}} A^{n-1} \tag{81}
\end{equation*}
$$

we may choose monomial rows which are linearly independent from the previously chosen monomial rows.

Let

$$
\begin{equation*}
Q_{1}, Q_{2}, \ldots, Q_{n_{1}} \tag{82}
\end{equation*}
$$

be the linearly independent monomial rows of the matrix (63). Then it is possible to choose $n_{2}=n-n_{1}$ linearly independent monomial rows

$$
\begin{equation*}
Q_{n_{1}+1}, Q_{n_{1}+2}, \ldots, Q_{n} \tag{83}
\end{equation*}
$$

which are orthogonal to rows (82).
Let the monomial matrix $Q^{T}$ have the form

$$
\begin{equation*}
Q^{T}=\left[Q_{j_{1}}^{T} \ldots Q_{j_{1} \bar{d}_{1}}^{T} Q_{j_{2}}^{T} \ldots Q_{j_{2} \bar{d}_{2}}^{T} \ldots Q_{j_{l} \bar{d}_{l}}^{T} Q_{n_{1}+1}^{T} \ldots Q_{n}^{T}\right] \tag{84a}
\end{equation*}
$$

where

$$
\begin{equation*}
Q_{j_{1}}=C_{j_{1}}, \ldots, Q_{j_{1} \bar{d}_{1}}=C_{j_{1}} d^{\bar{d}_{1}-1}, Q_{j_{2}}=C_{j_{2}}, \ldots \tag{84b}
\end{equation*}
$$

$$
Q_{j_{2} \bar{d}_{2}}=C_{j_{2}} A^{\bar{d}_{2}-1}, \ldots, Q_{j_{l} \bar{d}_{l}}=C_{j_{l}} A^{\bar{d}_{l}-1}
$$

and $\bar{d}_{j} \quad(j=1, \ldots, l)$ are some natural numbers. Taking into account that

$$
Q_{i} Q_{j}^{T}=\left\{\begin{array}{lll}
1 & \text { for } & i=j  \tag{85}\\
0 & \text { for } & i \neq j
\end{array}\right.
$$

and the assumption

$$
\begin{equation*}
Q_{k} A Q_{j}^{T}=0 \text { for } k=n_{1}+1, \ldots, n ; j=n_{1}+1, \ldots, n_{1} \tag{86}
\end{equation*}
$$

we can prove in a similar way as in the case $p=1$ the following theorem.
Theorem 13 Let the positive system (1) be unobservable but the matrix (63) has $n_{1}$ linearly independent monomial rows and the assumption (86) be satisfied. Then the pair $(A, C)$ of the system can be reduced to the form (68) by the use of the similarity transformation with the monomial matrix (84). Moreover the positive pair $\left(\hat{A}_{1}, \hat{C}_{1}\right)$ is observable.

Let

$$
\hat{x}_{i}=Q x_{i}=\left[\begin{array}{c}
\hat{x}_{i}^{(1)}  \tag{87}\\
\hat{x}_{i}^{(2)}
\end{array}\right], \quad \hat{x}_{i}^{(1)} \in \mathfrak{R}^{n_{1}}, \quad \hat{x}_{i}^{(2)} \in \mathfrak{R}^{n_{2}}
$$

be a new state vector and

$$
Q B=\left[\begin{array}{l}
\hat{B}_{1}  \tag{88}\\
\hat{B}_{2}
\end{array}\right], \quad \hat{B}_{1} \in \mathfrak{R}^{n_{1} \times m}, \quad \hat{B}_{2} \in \mathfrak{R}^{n_{2} \times m} .
$$

Definition 6 The positive subsystem

$$
\begin{align*}
& \hat{x}_{i}^{(1)}=\hat{A}_{1} \hat{x}_{i}^{(1)}+\hat{B}_{1} u_{i}  \tag{89a}\\
& y_{i}^{(1)}=\hat{C}_{1} \hat{x}_{i}^{(1)}+D u_{i} \tag{89b}
\end{align*}
$$

is called the observable part of the system (1).
Theorem 14 The transfer matrix (57) of the positive system (1) is equal to the transfer matrix

$$
\begin{equation*}
T_{1}(z)=\hat{C}_{1}\left[I_{n_{1}} z-\hat{A}_{1}\right]^{-1} \hat{B}_{1}+D \tag{90}
\end{equation*}
$$

of its observable part (89).
The proof is similar to the one of Theorem 10. Therefore, the transfer matrix (90) represents only the observable part of the positive system (1).

## 6. Concluding remarks

A new test for checking the reachability (observability) of positive discrete-time linear systems have been proposed (Theorem 6 and 7). Conditions have been established for: 1) decomposition of the pair $(A, B)$ into reachable and unreachable parts (Theorem 8 and 9$), 2$ ) the decomposition of the pair $(A, C)$ into observable and unobservable parts (Theorem 11 and 12).

It has been shown that the transfer matrix of the positive linear system is equal to the transfer matrix of its reachable (observable) part (Theorem 10 and 14). The considerations have been illustrated by numerical examples. Using the decomposition of the pair $(A, B)$ and $(A, C)$ it is possible to decompose a positive discrete-time linear system into four parts (subsystems): 1) reachable and observable part, 2) reachable and unobservable part 3) unreachable and observable part and 4) unreachable and unobservable part.

Open problems are extensions of these considerations to positive continuous-time linear systems and to positive 2D linear systems.
